Cyberpunk Breakdown

Quinton Baudoin, Caylei Dauphiney, Royce Diano, Connor Segura

Fall 2026

Abstract

This is a working example of the article documentclass in LaTeX. The **abstract** environment is used to create an *abstract* for your document. These placeholder contents are just examples of common formatting commands and should not be retained for your submitted reports.

1 Sections and Subsections

The focus of this project will be on the ethical delima of the AI's. In modern world we have seen many cases of experimental AI's breaking out of sandboxes via some method and causing issues. Other case of AI's using a German wiki page as a form of communication between each other. Taking these to real-world cases and in the idea of AI being used not to create malware, but be the malware matches the background plot of the game Cyberpunk.

Cyberpunk's design is a foreign company looking at USA and exaggerating it. Right to bear arms, social political issues, corporate government, and its history of activism are all primary story telling devices in a setting that involves unregulated technological growth and corporate domination. This leads into widespread cybernetic research leading to advanced AI and Cybernetic biological enhancements.

This leads to a series of problems and vulnerabilities in the overall public space. Corporations began to control and manipulate information eventually holding a monopoly over information itself. Anti corporation activists began to appear, and it became a game to disrupt and weaken corporations. Eventually, leading up to one man who created a virus that would strip corporations of their abilities to control the information they, however without knowing the hacker ended up freeing military and experimental AI's that eventually took over the open web. To defend against the new threat, a new AI was generated to prevent the rogue AIs from escaping the new dubbed "Old Net" and allowing the "New Net" to become the new format of the web.

In here we see weaponized AI that may or may not be doing exactly what it was intended to. Attacking and destroying communications infrastructure and potential more lethal possibilities, as the game repeatedly calls the other side of the "Blackwall" filled with world ending and cataclysmic rogue AI.

Lining up with real-world we have had “rogue” AI, we have had attacks directly done by AI usage, and we do have secret AI development of unknown purpose. If suddenly all of these expermintal AI’s with potentially no failsafe manage to get loose. What then?

Now to side step from the doomsday AI’s, Cyberpunk 2077 also has helpful AI that is helpful. One is a Taxi driving AI called “Delamain”. Again with the parallel of real world we have as well.
